

SMART-FARMING FROM A VETERINARIAN'S PERSPECTIVE

Congress for veterinarians
and farmers for the Central European region

When: 29th April 2025, 09:00 - 16:00

**Where: Brno Exhibition Centre, Hall P, 2nd floor, Congress Hall P4,
as part of the AnimalTech fair**

The congress focuses on the application of smart farming technologies in veterinary practice, including the use of animal data collection, telemedicine and automation. It will also address the ethical and legislative aspects that need to be considered when implementing these innovations in animal husbandry.

The aim of the congress is to stimulate discussion on the synergies between technology and veterinary medicine, and to show how to work together to contribute to more sustainable and efficient livestock farming in the Central European region.

What is the scope for preventive procedures, vaccinations and therapy in smart farming procedures?

Speakers are from the field of veterinary legislation, government, scientific and practical veterinary community.

We invite you to participate in the discussion on the direction the veterinary profession should take in these dynamic times. Together we can look for ways and aspects of smart farming and its impact on animal welfare, or the risk of depersonalization in veterinary practice.

The organiser:

Veterinary Research Institute, Brno under the auspices of Ministry of Agriculture of the Czech Republic.
